Moving Windows Recovery Partition Correctly

June 10, 2023 by theDXT

Recently I needed to expand a disk on a Windows 10 VM and a Windows Server 2022 VM, but I couldn't because the Recovery Partition was in the way.

When searching for a way to do this I discovered that the internet is full of posts about simply deleting the Windows Recovery Partition. I am not a fan of simply deleting a recovery tool. On numerous occasions the recovery partition has been instrumental in helping me to fix a system.

If you search for how to move the Windows Recovery Partition the internet has many posts of fake ways to do it or ways to do it with third-party tools like GParted. I have nothing against third-party tools or GParted and I don't doubt some of those methods do work. The issue I have with those methods is that you have to take the system offline in order to do them or the tools cost money.

Now yes you could just delete the Windows Recovery partition, but before you do that make sure you understand that you will lose a bunch of recovery options. You can read more about the recovery options you'll lose in an earlier post I made about the [Windows Recovery Partition](#).

This is what my partitions look like in Disk Management.

We will move the 1 GB recovery partition to the end of the disk allowing us to add the 50 GB of unallocated space to the C drive.

The Process

- Make sure you have a backup of the system you are going to edit the partitions on.
- Open Command Prompt as admin

Run CMD as admin

Disabling The Windows Recovery Partition

yyc

```
C:\Windows\system32>reagentc /disable
REAGENTC.EXE: Operation Successful.
```

Disabling the Recovery Partition

The `reagentc /disable` command will disable the recovery partition and will move the recovery partition into a file named `Winre.wim` and will be located in `C:\Windows\System32\Recovery` (you have to enable showing hidden system files if you want to see it)

Name	Date modified	Type	Size
ReAgent.xml	2023-06-03 2:03 PM	XML Document	2 KB
Winre.wim	2022-09-07 8:57 PM	wim Archive	438,745 KB

The Windows Recovery Partition File

DiskPart

- Run the command `diskpart` to launch DiskPart

```
C:\Windows\system32>diskpart

Microsoft DiskPart version 10.0.19041.964

Copyright (C) Microsoft Corporation.
On computer: DXT-H0-PVDI01

DISKPART> _
```

Launching DiskPart

- List the disks in your system. You can do this by using the command `list disk`

```
DISKPART> list disk

Disk ###  Status       Size       Free       Dyn  Gpt
-----  -
Disk 0    Online      200 GB     50 GB           *
```

Listing the disks in DiskPart and showing the disk is a GPT disk

Pro tip from Matt in the comments, if there's a * in the column for Gpt that means the disk is likely a GPT disk and if there isn't a * in the Gpt

- Select the disk you need to move the recovery partition on. You can do this by using the command `select disk` and the disk number. In my setup disk 0 was the correct disk and the command I entered was `select disk 0`.

```
DISKPART> select disk 0
Disk 0 is now the selected disk.
```

Selecting the disk in DiskPart

- List the partitions on that disk. You can do this by using the command `list partition`

```
DISKPART> list partition

Partition ###  Type                Size      Offset
-----
Partition 1    System              100 MB    1024 KB
Partition 2    Reserved            16 MB    101 MB
Partition 3    Primary             148 GB    117 MB
Partition 4    Recovery            1024 MB    148 GB
```

Listing the partitions in DiskPart

- Select the recovery partition. You can do this by using the command `select partition` and the partition number. In my setup partition 4 is my recovery partition and the command I entered was `select partition 4`

```
DISKPART> select partition 4
Partition 4 is now the selected partition.
```

Selecting the partition in DiskPart

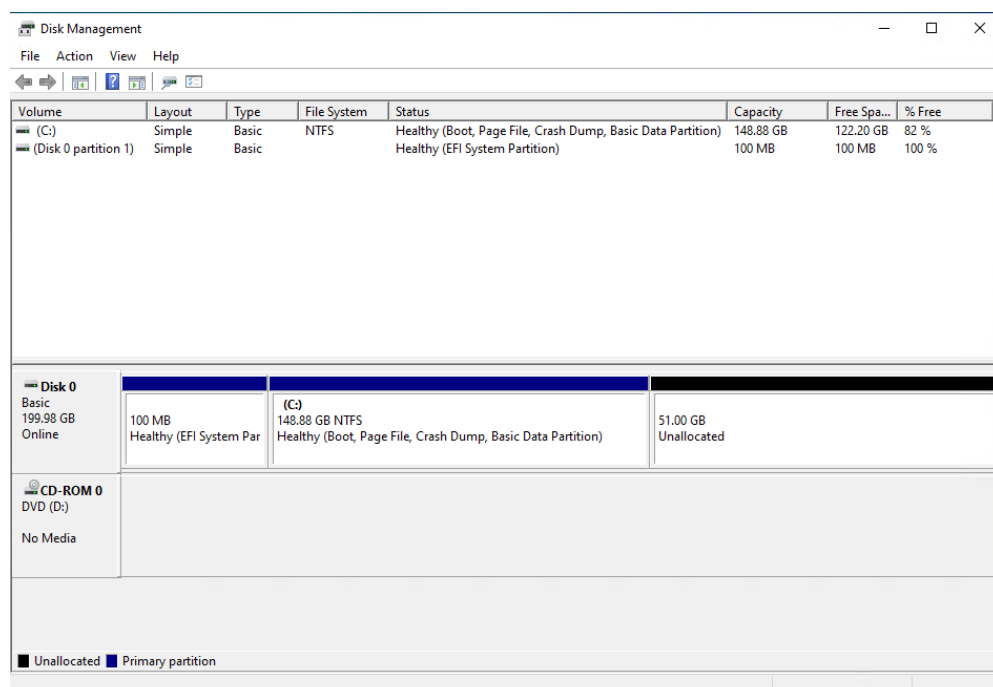

The recovery partition is a protected partition so we need to use a bit more force to delete it.

- Force the deletion of the recovery partition. You can do this by using the command `delete partition override`

```
DISKPART> delete partition override
DiskPart successfully deleted the selected partition.
```

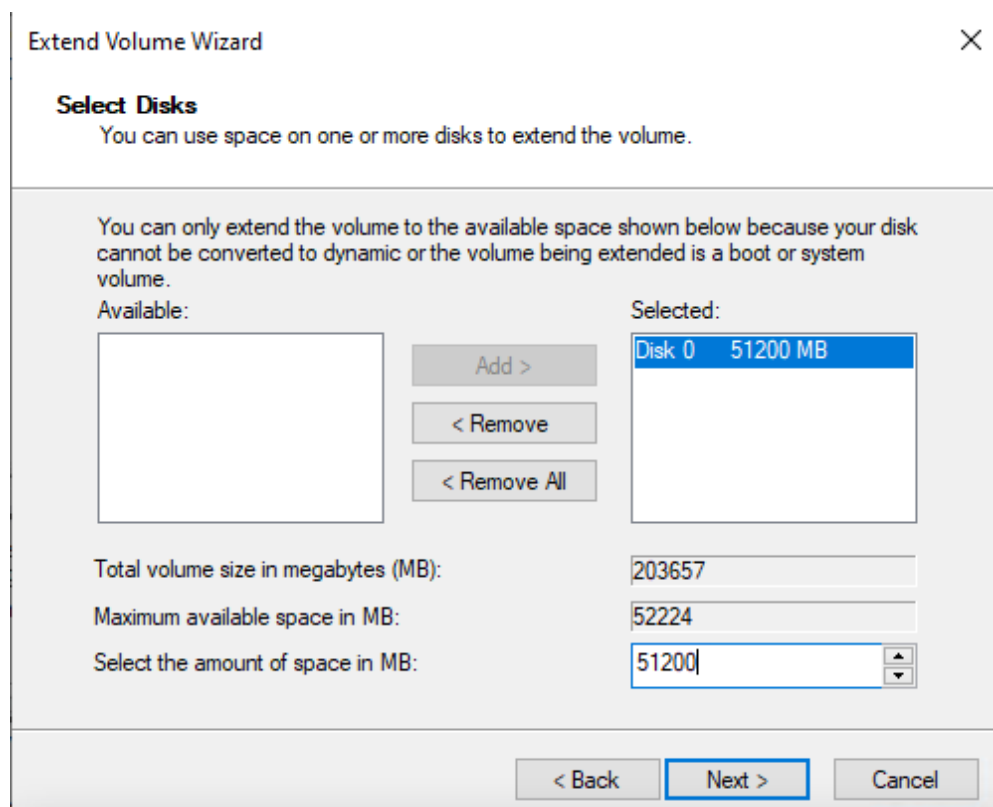

Disk Management

Now if you look in Disk Management you should no longer have the Recovery Partition and it should show up as unallocated.

Disk Management with the Recovery Partition deleted

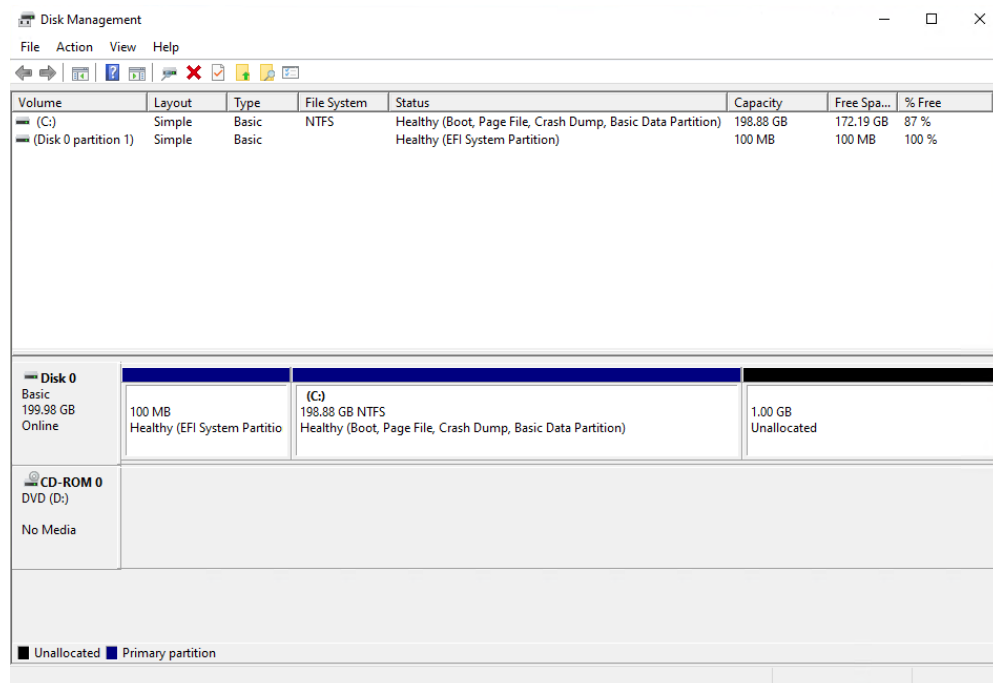

- Expand your disk and leave about 1024 MB off your resized size to leave room for the re-enabling the Recovery Partition.

Accept

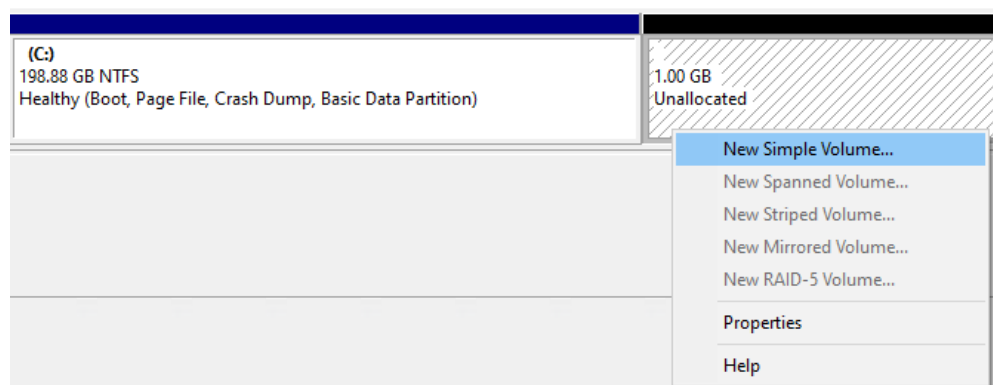

Disk Management should now look something like this.

Disk Management after expanding the disk and leaving room for the Windows Recovery Partition

Once the disk is expanded we need to rebuild everything that is needed for Windows to know that the extra space that we left unallocated can be used to for the recovery partition.

- Create a New Simple Volume with the unallocated space.

Creating a New Simple Volume

- Don't give it a drive letter.

New Simple Volume Wizard ✕

Assign Drive Letter or Path
For easier access, you can assign a drive letter or drive path to your partition.

Assign the following drive letter: E ▾

Mount in the following empty NTFS folder:
 Browse...

Do not assign a drive letter or drive path

< Back Next > Cancel

Not giving the New Simple Volume a drive letter or a drive path

- You can give the new partition a name if you want it does not mater. I'm going to call mine New Recovery.

New Simple Volume Wizard ✕

Format Partition
To store data on this partition, you must format it first.

Choose whether you want to format this volume, and if so, what settings you want to use.

Do not format this volume

Format this volume with the following settings:

File system: NTFS ▾

Allocation unit size: Default ▾

Volume label:

Perform a quick format

Enable file and folder compression

< Back Next > Cancel

Naming the New Simple Volume

Disk Management should now look something like this.

Accept

commands.

GPT disk

On GPT disks we need to change the partition ID to **de94bba4-06d1-4d40-a16a-bfd50179d6ac** which tells Windows that this is a recovery partition

- Run the following command to set the partition as a recovery partition `set id=de94bba4-06d1-4d40-a16a-bfd50179d6ac`

```
DISKPART> set id=de94bba4-06d1-4d40-a16a-bfd50179d6ac
DiskPart successfully set the partition ID.
```

Setting the GPT partition ID in DiskPart

We also need to hide the drive and flag it as a required partition to do that we have to set a GPT attribute to **0x8000000000000001**

- Run the following command to set the GPT attribute to hide the drive and flag it as required `gpt attributes=0x8000000000000001`

```
DISKPART> gpt attributes=0x8000000000000001
DiskPart successfully assigned the attributes to the selected GPT partition.
```

Setting the GPT attribute in DiskPart

- Now we can exit DiskPart.

```
DISKPART> exit
Leaving DiskPart...
C:\Windows\system32>_
```

Exiting DiskPart

MBR disk

On MBR disks we need to change partition ID to **27** which will tell Windows that this is a recovery partition.

- Run the following command to set the partition as a recovery

We use cookies on this page to better serve you. You can find more information about cookies [here](#).

Accept

```
DISKPART> set id=27  
  
DiskPart successfully set the partition ID.
```

setting the MBR partition ID in DiskPart

- Now we can exit DiskPart.

```
DISKPART> exit  
  
Leaving DiskPart...  
  
C:\Windows\system32>_
```

Exiting DiskPart

Enabling The Windows Recovery Partition

- Now we can re-enable the recovery partition by running the command `reagentc /enable`

```
C:\Windows\system32>reagentc /enable  
REAGENTC.EXE: Operation Successful.
```

Enabling the Windows Recovery Partition

The `reagentc /enable` command will copy the `winre.wim` file from `C:\Windows\System32\Recovery` into our new recovery partition.

Windows Recovery Partition file is now back on the recovery partition

If you look at Disk Management again everything shows up correctly.

The screenshot shows the Windows Disk Management console. At the top, there is a table listing volumes. Below that, a detailed view of Disk 0 is shown, including a bar chart at the bottom.

Volume	Layout	Type	File System	Status	Capacity	Free Spa...	% Free
(C:)	Simple	Basic	NTFS	Healthy (Boot, Page File, Crash Dump, Basic Data Partition)	198.88 GB	172.61 GB	87 %
(Disk 0 partition 1)	Simple	Basic		Healthy (EFI System Partition)	100 MB	100 MB	100 %
(Disk 0 partition 4)	Simple	Basic		Healthy (Recovery Partition)	1.00 GB	1.00 GB	100 %

Volume	Layout	Type	File System	Status	Capacity	Free Spa...	% Free
(C:)	Simple	Basic	NTFS	Healthy (Boot, Page File, Crash Dump, Basic Data Partition)	198.88 GB	172.61 GB	87 %
(Disk 0 partition 1)	Simple	Basic		Healthy (EFI System Partition)	100 MB	100 MB	100 %
(Disk 0 partition 4)	Simple	Basic		Healthy (Recovery Partition)	1.00 GB	1.00 GB	100 %

Volume	Layout	Type	File System	Status	Capacity	Free Spa...	% Free
(C:)	Simple	Basic	NTFS	Healthy (Boot, Page File, Crash Dump, Basic Data Partition)	198.88 GB	172.61 GB	87 %
(Disk 0 partition 1)	Simple	Basic		Healthy (EFI System Partition)	100 MB	100 MB	100 %
(Disk 0 partition 4)	Simple	Basic		Healthy (Recovery Partition)	1.00 GB	1.00 GB	100 %

That's all there is to it.

Technically speaking we did just delete the Windows Recovery Partition but we did so in a way to keep our existing recovery partition safely intact and then we rebuild the recovery partition and re-enabled it.

I prefer doing it this way as it leaves your recovery options intact and you can do it all live without any reboots.

If you want to read more about deploying the Windows Recovery Partition you can do so by reading [Microsoft's documentation about it](#).

If you want to read more about reagentc command you do so by reading [Microsoft's documentation about it](#).

Dzery August 22, 2023 at 5:37 am

Thank you, I tried your solution and it worked very well. I like it because it does not need third party software and preserves recovery partition. Your description is very clear and detailed.

Daniel Keer August 22, 2023 at 6:53 am Post author

That's awesome! I'm glad it worked out.

Reply

Steve December 27, 2023 at 8:21 am

Agreed. This saved me a couple of hundred bucks!
